Il lavoro incontra nuovi contesti: nasce a Livigno il primo Ski Working Hub

L'OMS ha dato una definizione di Salute come "uno stato di completo benessere fisico, mentale e sociale e non semplicemente l'assenza di malattia o infermità".

UP150 nasce dall'intuizione di Progetto Design & Build (Gruppo Progetto CMR) condivisa con il Prof. Pietro Lugi Invernizzi (Dip. di Scienze Biomediche per la Salute dell'Università degli Studi di Milano) e con Bip Group.

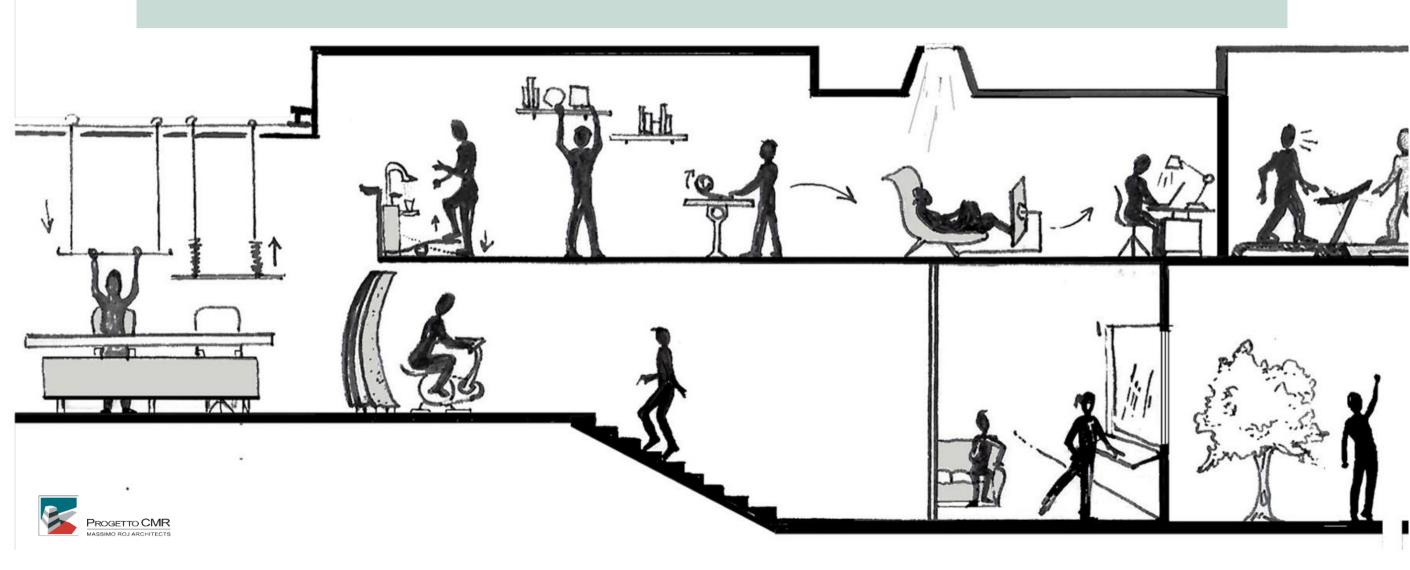

Scopo del progetto è combattere la sedentarietà con un ciclo di allenamento che si inserisce nelle azioni della normale giornata lavorativa

... con un programma di esercizi che punta principalmente ad una riduzione dei rischi di malattie non trasmettibili

Abstract: Physical activity (PA) is a major health factor and studies suggest workplaces could promote PA by modifying office design, motivational strategies and technology. The present study aims to evaluate the efficiency of UP150, a multifactorial workplace intervention for the improvement and maintenance of the level of physical fitness (PF) and wellbeing. Forty-five employees were randomly divided into the experimental (EG) and control (CG) groups. The PF was assessed pre-post intervention using the cubo fitness test (CFT), the amount of PA was evaluated using the IPAO questionnaire and accelerometers while the workload was assessed using the NASA-TLX questionnaire and psycho-physical health by using the SF-12 questionnaire. The EG worked in UP150 offices while the CG worked in their usual offices for 8 weeks. The EG and CG came back 4 weeks after the intervention for CFT retention. The EG improved CFT motor efficiency and the amount of moderate PA, while it reduced mental load. The EG retained reached motor efficiency levels 4 weeks after the intervention. No differences were found in IPAQ. The UP150 demonstrated to be a proactive environment and to be efficient in the promotion of PA, improving PF and mental health while decreasing mental load.

Keywords: motor efficiency; workplace; physical activity; self-determination; effort perception

The workplace represents one of the main causes of sedentarism and stress, which negatively affect the quality of life [1]. The incoming of the SARS-CoV-2 pandemic has changed usual working habits and has introduced the concept of smart working, which has caused a reduction in the costs for the companies accompanied by a reduction in employees' working involvement and a decrease in working performances [2,3]. To act on the movement's education and on employees' motivation, a methodology is proposed that can determine an easy and non-traumatic transition from the classic workplace concept (based on constriction, stress and health risks due to a sedentary lifestyle) to a new workplace environment and office's design concept, which consider the well-being and the caring of employees as central elements of companies' welfare strategies [4].

The innovation of this methodology consists of the insertion of systems that can increase the motivation to perform physical activity, through the increase in autonomy, relatedness, and the positive perception of self-motor competence [5]. More specifically, a training system is proposed based on effort perception, which aims to integrate physical activity to professional working rhythms, promoting a conscious physical practice, adequate to the individual's psycho-physical condition and to the working context.
